Business model: B2C. The student uses Juthoor; the parent/guardian pays. Price hypothesis: Free 0 JOD, Pro Monthly 4.50 JOD/month, Pro Academic Year 32 JOD/year. Teachers and schools are distribution/validation channels only.

1. Who We Reach First

Item	Definition
Students	Grades 5–7 in Amman studying mathematics; start with Grade 6 because the MVP content exists there.
Buyer	Parent/guardian who receives the gap report and decides whether to subscribe.
Hook	Free diagnostic → root-gap report → targeted remediation → retry.
Not first	Public-school rollout, unbuilt grades/subjects, paid teacher/school product.

2. Acquisition Channels

Channel	Action	Evidence status
Free diagnostic	Primary entry point; shareable parent gap card.	Not yet tested.
Student social content	Arabic short videos, hidden-gap concept, streaks/friend challenges.	24/34 chose friend challenges; convenience sample.
Parent communities	Arabic posts about recurring learning gaps; CTA to diagnostic.	Not tested with parents.
Referral	Completed diagnosis invites friend; one week Pro reward.	Not tested.
Ambassadors	Small peer cohort shares diagnostic.	Not tested.

Channel	Action	Evidence status
Paid digital	Small capped parent-targeted ad tests.	Public CPC reference; Juthoor conversion unknown.
Teacher distribution	Selected teachers share diagnostic and blind-review diagnoses.	Distribution + validation; no payment/commitment claimed.

Paid advertising is a test, not the business model. Because Task 2 economics are CAC-sensitive, the plan prioritizes free/low-cost channels and uses paid spend only with explicit caps.

3. First 30 Days — Experiments

Key assumption: parents of Grade 5–7 students who see a free diagnostic and useful gap report will register, complete the experience, and some will choose Pro at the tested price. Thirty days can reveal funnel breakage and early intent; it cannot prove long-term retention.

Experiment	Metric	Target / interpretation	Window
E1 Landing page	Visitor→registration	≥25% hypothesis	1–30
E2 Diagnostic	Start→completion	≥40% hypothesis	1–30
E3 Parent interviews	15 parents who saw report	≥5/15 say they would pay; record objections; statements are weak evidence	10–30
E4 Refundable pre-order	Pre-orders/completions; annual share	≥3%; annual ≥40%	20–30+
E5 Referral	Invites/completion; referral share	≥0.3; ≥20%	1–30
E6 Acquisition	Cost/registered user	≤1.80 JOD target; >3 JOD triggers stop/rework	1–30

A 300 JOD test budget at an indicative 0.30–0.70 JOD CPC buys roughly 430–1,000 visits. Early results will therefore be reported as counts and funnel rates, not as proof of product-market fit.

4. Days 31–90

Experiment	Metric	Target / purpose
E7 Monetisation + retention	Free-to-paid; monthly retention; annual share; CAC/payer	≥3.5%; ≥88%; ≥40%; ≤18 JOD
E8 Teacher distribution + blind validation	Channel sign-ups; independent root agreement; usefulness 1–5	Compare channels and test diagnosis quality; no school commitment claimed.
E9 Parent WTP survey	100 parents; price points include 4.50/month and 32/year	Report price curve/objections; no pass/fail because sample is self-selected.

Reliability rule: do not treat a conversion or retention percentage as a strong signal until at least 300 registered free users and 20 payers exist. Below that, report raw counts and uncertainty.

5. First 30 Days — Execution

Days	Action	Output
1–5	Instrument visit→registration→start→completion→report→plan choice; finish Arabic parent report and interview guide.	Measured funnel.
6–10	Soft launch; first ambassadors; challenge/referral loop; ads capped at 100 JOD.	First readings.
11–20	15 parent interviews; parent content twice weekly; raise ads only if registration cost is acceptable.	WTP + acquisition signal.
21–30	Enable refundable pre-order with both plans; compare channels; publish evidence note.	Pre-order + plan-choice results.

6. 30-Day Decision Rules

Result	Action
Registration ≥25%, completion ≥40%, cost/registration ≤1.80 JOD	Continue to 90 days with same message.
Registration or completion materially below target	Fix landing page/diagnostic before increasing spend.
Cost/registration >3 JOD with weak organic/referral	Stop/limit paid ads; prioritize communities, ambassadors and teacher sharing.
<3/15 parents say they would pay	Do not claim demand; investigate objections and packaging. Keep 32 JOD as the current price-floor hypothesis rather than lowering automatically.

7. 90-Day Decision Gates

Observed result (≥300 free users + 20 payers)	Decision
Free-to-paid <2% OR CAC/payer >45 JOD	No hiring/scale-up; revisit packaging/content; stay Stage 1.
Free-to-paid 2–3.5% AND churn >12%	Stay lean; grow only through low-cost/free channels.
Free-to-paid ≥3.5%, retention ≥88%, CAC/payer ≤18 JOD, referrals ≥20%	Open paid roles one at a time; rerun Task 2 with measured economics.
Free-to-paid ≥5% with same retention/CAC	Prepare scale-up only after longer verification; funding only with updated evidence.

These are decision gates, not forecasts. They prevent hiring, heavy advertising or fundraising from getting ahead of evidence.

8. Resources, Risks & Next Steps

Item	Plan
Team	Four members split product/diagnosis, growth/content, parent research/partnerships, analytics/operations. No paid staff before the gate.
90-day budget	≈1,900 JOD at Stage 1 planning cost, including 300 JOD/month test marketing; no funding source assumed.
Payments/tax	Confirm GST, registration threshold, gateway fees and refunds before taking real money.
Child data	Parent consent/account, minimum necessary data, clear privacy notice.
Main risks	Low registration/noisy sample; price/value mismatch; weak referral; teacher reluctance; diagnosis quality weaker than six selected cases.

- Immediate: instrument the funnel end-to-end.
- Immediate: finish the Arabic parent report and interview guide.
- Immediate: verify payment/tax/privacy setup before real payments.
- Immediate: recruit the first ambassador and teacher-validation cohorts.
