1. Business Model

Element	Definition
User	Student; initial focus Grades 5–7, MVP content Grade 6 mathematics.
Economic buyer	Parent/guardian.
Pricing hypothesis	Free 0 JOD; Pro Monthly 4.50 JOD/month; Pro Academic Year 32 JOD/year.
Paid value	Root-chain diagnosis, guided prerequisite path, printable parent gap report.
Teachers/schools	Distribution and validation channels only; no paid school/teacher revenue modelled.

The 32 JOD academic-year price is the current minimum price hypothesis for testing, not validated willingness-to-pay. Higher prices remain a future sensitivity test; no market ceiling is claimed.

2. B2C Market Funnel

Step	Estimate	Basis / status
Total school students 2023/24	2,307,110	DoS Yearbook 2024 [1]
Excluding kindergarten	2,143,249	DoS [1]
Grades 4–9	≈1,070,000	Assumption: six of twelve grades; equal cohorts
Digitally reachable	≈750,000	Assumption: 70%
Serviceable families	≈225,000	Assumption: 30% of reachable; not measured

This is a planning funnel, not a measured TAM/SAM/SOM. The Growth scenario is an upper stress test, not a forecast. The model must be replaced with observed acquisition and payment data after the 90-day test.

3. Competitive Context

Relevant alternatives are private tutoring, curriculum/content platforms and general-purpose chatbots. Juthoor's intended distinction is not “more content”; it is evidence-first prerequisite diagnosis, a targeted return path and a parent-facing gap report.

Alternative	What the family gets	Relevant price/context	Juthoor distinction
Private tutoring	Human explanation and exam support	Existing source [3] (dated, 2013) reports roughly 100–150 JOD/month of family tutoring spending; not a current price benchmark.	Automated prerequisite tracing and repeatable diagnosis at a lower tested price hypothesis.
Abwaab / online learning platforms	Online curriculum content and practice	No verified public price is used in this document; none is assumed.	Starts from the learner's gap rather than only the current topic.
Video/content libraries	Large libraries and practice	Pricing varies by provider; not benchmarked here.	Starts from the learner's gap rather than only the current topic.
General AI chatbots	On-demand answers/explanations	Pricing varies by provider; not benchmarked here.	Tracks prerequisite evidence and can abstain when evidence is insufficient.
Juthoor	Free diagnostic; Pro adds root-chain diagnosis, guided prerequisite path and printable parent gap report	Price hypotheses: Free 0 JOD; Pro Monthly 4.50 JOD/month; Pro Academic Year 32 JOD/year.	Evidence-first prerequisite diagnosis, a targeted return path and a parent-facing gap report.

Competitive position. Juthoor is not positioned as the largest content library or the cheapest learning platform. Its intended advantage is the diagnostic layer: tracing errors through prerequisite relationships, requiring sufficient evidence before naming a root, and turning that diagnosis into a targeted remediation path. This distinction still needs to be validated against real family behavior and competing products.

Pricing conclusion: 4.50 JOD/month and 32 JOD/academic year are the current test prices. Existing evidence does not establish a ceiling at 32 JOD, so we do not claim that higher prices are unsupported.

4. Unit Economics: What Must Be True

Driver	Current treatment	Validation
Free-to-paid	Scenario assumption	Observed conversion after ≥300 registered free users.
Retention/churn	Scenario assumption	Observed month-to-month payer retention.
CAC	Scenario assumption	Blended spend ÷ new payers.
Referral share	Strategic assumption	Measured share of registrations from referrals.
Annual-plan choice	Assumption	Observed checkout/pre-order plan choice.

5. Lean Company Cost Model

Monthly JOD	Stage 1	Stage 2	Stage 3
Engineers	0	700	2,400
Product/operations	0	600	1,500
Education/content	0	300	1,200
Support	0	200	800
Growth/marketing staff	0	350	1,400
Employer social security	0	306	1,040
Office/coworking	0	150	500
Hosting/DB/monitoring/email/analytic s	130	250	1,200
Software	60	150	500
Accounting	40	150	400
Legal	40	80	250
Licences/insurance	0	50	150
Fixed marketing/tests	300	600	2,000
Contingency	57	389	1,334
TOTAL	≈630	≈4,275	≈14,674
Annual	≈7,600	≈51,300	≈176,100

These are planning assumptions, not quotations. Payment fees, refunds, per-user infrastructure, paid ads and tax are handled separately in the original financial model and must be confirmed before launch.

6. Three-Year Reality Check

Scenario	Year-3 paying students	Interpretation
Conservative	≈800	Does not support a full-company cost base.
Base	≈4,100	Can work only with strong acquisition efficiency and a lean cost base; scaling to Stage 3 creates a large gap.
Growth / stress test	≈15,700 in the detailed model	Requires unusually strong conversion/acquisition; upper scenario, not forecast.

Three-Year Financial Snapshot

Scenario	Year-3 paying students	Against Stage 2 break-even (≈2,400/year)	Against Stage 3 break-even (≈8,200/year)
Conservative	≈800	Below	Below
Base	≈4,100	Above	Below
Growth / stress test	≈15,700	Above	Above

At the current 32 JOD price, revenue per payer is relatively limited, so scale alone does not solve the economics. The key variables are free-to-paid conversion, retention, CAC and the share of users acquired through low-cost channels. Before increasing the team or paid acquisition budget, these variables must be measured in the 90-day validation period.

At the current 32 JOD price, the business has limited revenue per payer. A sustainable company therefore depends on measured conversion, retention and low-cost acquisition. Additional validated grades/subjects or family-level expansion could increase revenue per family, but none is assumed as current evidence.

7. Break-Even Logic

Break-even reference:

≈2,400 paying students/year at Stage 2 cost;
≈8,200 paying students/year at Stage 3 cost;
before acquisition effects.

The current model estimates about 2,400 paying students to cover a Stage 2 annual cost base of ≈51,300 JOD and about 8,200 to cover Stage 3 ≈176,100 JOD, before acquisition effects. These are planning outputs, not forecasts.

The model becomes more credible only if measured data shows stronger conversion, longer retention, lower CAC, substantial organic/referral acquisition, or higher revenue per family. These are hypotheses to test, not claims.

8. Risks & Mitigation

Risk	Mitigation
Conversion/churn assumed	Measure before hiring.
Value-for-price: nine current Grade 6 lessons	Test parent WTP, pre-orders and annual-plan choice; sell diagnosis/value, not content volume.
CAC > LTV	Cap paid spend; prioritize organic/referral/community channels.
Diagnosis quality unproven	Blind multi-educator validation and answer-count evidence.
Seasonality	Academic-year plan and calendar-aligned campaigns.
Child data/trust	Parent account/consent, minimum data, privacy notice.
Team capacity	Hire only after Task 3 gates.

9. Validation Plan

The next 90 days are designed to replace assumptions with observed values: registration, diagnostic completion, parent willingness-to-pay, pre-orders, free-to-paid conversion, retention, referral share, and CAC. Task 3 defines the experiments, measurement rules, and decision gates. After the 90-day test, Task 2 will be rerun using the measured values rather than the original assumptions.

What changes after validation. Measured free-to-paid conversion, retention, CAC, referral share, annual-plan selection and parent willingness-to-pay will replace the current assumptions in the financial model. The team will not scale hiring or paid acquisition based on the current projections alone.
